RESEARCH INTERESTS

My research focuses on scalable robot learning, with an emphasis on data-efficient human feedback (gaze, demonstrations, preferences, interventions) and reward foundation models that provide generalizable reward functions across tasks, embodiments, and environments. I also work on core components for embodied intelligence, including vision-language-action models for low-level control, trace models for structured planning, and world models for scene understanding and predictive reasoning. In parallel, I am investigating RL post-training for LLM-based web agents to improve reliability in sequential UI tasks and long-horizon interactions.
